TROUBLESHOOTING

If unable to pair numpad to device, confirm that the device you're trying to pair with is Bluetooth-capable. If so, restart the device and try pairing it with the numpad again.

Note: On a Windows computer, a new Bluetooth connection will sometimes require additional software updates—a process that may still be ongoing after a message appears indicating a successful completion. Wait at least 20 minutes after pairing to make sure all updates are completed before restarting the computer.

Confirm that the device is configured to accept Bluetooth connections (Windows) and supports an external numpad (HID profile).

Go to Bluetooth Devices > Open Settings and select the following:

Allow Bluetooth devices to find this computer

Allow Bluetooth devices to connect to this computer

Alert me when a Bluetooth device wants to connect

My numpad isn't working in Bluetooth mode.

For the computer/smartphone:

Go to your device Bluetooth settings>Select the numpad and remove/delete/unpair it.

Then restart your device.

For the numpad:

Turn the numpad off and back on. Then reconnect it to your device.

My numpad isn't working in 2.4 GHz mode.

Ensure the toggle is set to 2.4 GHz, remove the receiver from your device, and press"fn"+"X" for 4 seconds to force pair, then reinsert the receiver into the device, keeping the numpad within 20 cm of the receiver for optimal pairing.

Wireless connection is interrupted even within 10 meters.

Check if the numpad is resting on a metal surface that can interfere with the wireless signal.

Safety Precaution:

Keep the product, accessories and packaging parts out of the reach of children to prevent any accidents and choking hazards.

Always keep the product dry to avoid corrosion.

Do not expose the product to extreme temperatures below -10°C(14°F) or above 50°C(122°F) to preserve the lifespan of the numpad.
