New Features

- Adds support for auto image flip. There's a new Vaddio feature called "Auto Image Flip" checkbox in the System tab of the Web UI. When checked, enabling and disabling the familiar "Image Flip" is disallowed, but it will instead flip based on its physical mounted orientation. Otherwise, image flip works as it always has.
- The previously unused Position A, B, D and F on the rotary switch now enables software control of video output resolution. When the switch is set to software control mode, the administrator sets video resolution via the web interface, on the General tab of the System page in the Web UI of the camera.
- Camera chained-preset { recall | stop } CLISH command is now available if any preset chains have been defined in the camera's web interface.
- Camera ICR {get | off | on} CLISH command is now available, this enables and disables the infrared cut filter on and off.

Improvements

- Improvements to address some reports of settings not persisting across firmware updates.
- Improved support for VISCA-over-IP with some codecs. This feature is experimental. Please contact Vaddio technical support if you encounter issues using it.
- Rotary switch position C - Factory Reset improvements.
- Added the ability to use the colon symbol in user passwords
