

PRODUCT UPDATE

CG35217-90° Cat6 RJ45 UTP Shielded Keystone Jack

Please note the following updates to one of our existing products, the 90°Cat6 RJ45 UTP Shielded Keystone Jack. As part of our ongoing commitment to enhance product quality and performance, we have made improvements that will provide a more stable and reliable connection for your network.

What Has Changed?

Our engineering team has made key updates to enhance connection stability with our cables. These improvements ensure better signal integrity and reduce connection drops, leading to smoother and more reliable network performance. The updates include:

- **Enhanced Shield Cap Design:** Now more robust, with a better click-in mechanism.
- **Improved Drain Wire Securing:** The drain wire is now secured with a separate nylon cable tie (included in the package) instead of the previously attached brass or nickel-plated cable tie.

Despite a slight change in dimensions, the jack still fits in standard-sized keystone wall plates. Additionally, the retainer clip is now black instead of white, and the shielding now has a matte finish.

What Does This Mean for You?

If you're currently using our **90° Cat6 RJ45 UTP Shielded Keystone Jack**, you'll notice improved connection stability with the updated version. Please note, a change in the installation process is required—refer to the Installation Instruction sheet on www.C2G.com
